THE tracings from which these Etchings of Molluscous Animals have been taken, were originally made by Mrs. GRAY, for my use, with the view of their being added to my collection of figures of Shells, and to aid me in their arrangement. Hoping that others may find such a collection of figures (many of them copied from expensive works, and brought together from sources not easily accessible to Conchologists in general) as useful as they have been to myself, I induced Mrs. GRAY to make slight etchings of them, which afforded her an interesting occupation when she has been confined to the house by ill health.

Some of the earlier figures, it should be stated, were taken from tracings made with no intention of their being copied, and intended only to represent the leading features of the original ; and this circumstance will explain why, in a few instances, the etchings do not convey all the characters of the original figure.

As the present work has been a labour of love, in order to bring it within the reach of Conchologists of

limited means, it is published at the cost of paper and printing.

The three volumes of plates now published complete the series of Gasteropodous and Pteropodous Mollusea. They form, I believe, the largest number of figures of the species of these animals that has hitherto been brought together in one work.

The explanations of the plates have been formed into a separate volume, for the purpose of more easy consultation; and to carry out this view, the references to the plates forming the first volume of the series have been reprinted. To this part of the work has been added a systematic distribution of the species figured, with the characters of the orders, families, and their subdivisions, and a list of the genera of Mollusca and their synonyma, originally printed in the Proceedings of the Zoological Society for 1847.

The series of plates containing the Conchiferous Mollusea is in hand, and will be published at a future period.

SYSTEMATIC ARRANGEMENT OF THE FIGURES.

THE genera are chiefly arranged according to the "List of the Genera of Recent Mollusca, their synonyma and types," printed in the Proceedings of the Zoological Society for 1847, a copy of which accompanies this volume. The number after the generic name refers to the number in the List, which shows the date of the generic name and its synonyma. When any new synonyma have occurred to me since the printing of that List, I have added the name after that of the genus.

Some alteration has been made in the disposition of the families. The observations of Messrs. Cuvier and Quoy, strengthened by the anatomical researches into the nervous system of these Mollusca by M. Gervais, and the researches into the structure and disposition of the siliceous teeth on the tongue-membranes of Dr. Loven, have shown that the *Trochidae*, *Turbinidae* and *Haliotidae* must be removed from the other Phytophagous Ctenobranchiata, and that the *Patellae* and allied families, and probably the *Chitones*, should be arranged with them.

The admirable researches of Dr. Loven on the metamorphosis of Mollusca and the structure of the tongue of these animals, has shown the necessity of several new families being established; for though the character furnished by the teeth on the tongue is difficult to observe, especially in the smaller animals, yet the modifications which they assume must be characteristic of important differences in the habit and organization of the animal.

The name of the author from whom the figure of the animal has been copied, precedes the reference to the plate in this work where the species is figured.

OF THE

GENERAL OF RECENT MOLLUSCA,

THEIR

SYNONYMA AND TYPES.

BY

J. E. GRAY, Esq., F.R.S. ETC.

A LIST OF THE GENERA OF RECENT MOLLUSCA, THEIR SYNONYMA
AND TYPES. BY J. E. GRAY, Esq., F.R.S. ETC.

The generic names which have been used in Mollusca have become so numerous that I have long thought it desirable that they should be submitted to a rigid examination, for the purpose of reducing those which are only synonyms of genera already established; and for the purpose of doing so with justice to previous writers, it is necessary that attention should be paid to the dates of their original publication, which have been too much neglected by several writers in this branch of zoology.

I have therefore sent to the Society the following list, which, though I have paid great attention to the subject, I am aware is yet very imperfect, as a commencement in what I consider the right direction, and I hope that it may be the means of drawing the attention of other students of this class of animals to the subject. I have been induced to send it in its present state, as I am constantly requested by both English and continental conchologists to supply them with copies of the Synopsis of the British Museum for 1838, 1840, 1842, and 1844, which contains a list of the genera of Mollusca, and which is now out of print, and also often to give them information with regard to the authorities for the several genera contained in that list, which shows that there is an evident want of some recent information on this subject.

It is needless for me now to dilate on the importance of attending to the law of priority, which I have always advocated, for that is now almost universally allowed; yet I am quite prepared for hearing several conchologists complain of the changes which the observance of this just law will force them to make: thus *Cyclostoma* and *Helicina*, instead of being applied to land-shells, must be the names of the *Delphinula* and *Rotella* of Lamarck's 'Histoire'; *Terebellum* that of *Turritella* of the same author; so that though these generic names are still used, they will have a different signification to their present one. Other names in very general use, as *Oliva*, &c., will have to be erased from the system, for this genus was established and well-characterized under the name of *Strephona*, by Browne (along with several other genera), between the publication of the tenth and twelfth editions of Linnaeus's 'Systema Naturæ,' though it has been overlooked by Lamarck and other authors.

I may here observe that the change with respect to *Cyclostoma* and *Helicina* is produced by Lamarck having used the same names with very different significations in his 'Système' and 'Histoire.' In the latter of these works he has in one or two instances altered the names which he had previously given to a genus; and in like manner allowed the names before used, such as *Meretrix* and *Donacilla*, to drop out of the system, no notice being taken of the change or its cause.

The method I have followed is to observe the first name given to the genus and the type on which it was founded, and then to accumulate the synonyma around the genus. Where a succeeding author has referred to a different species as the type of the genus, I have

given the name in a new line, as at some future period that type may be proved really to belong to a different genus; and when any succeeding author has established a genus on any species which appears to belong to the before-established genus, it is in a similar manner placed under the proper head, with the synonyma belonging to that type. The type on which the genus or subgenus, as it may hereafter prove, was founded, is also given, so that if such type at some future period prove to be distinct from the one under which I have placed it, the synonyma of the genus will be at once seen. But the names which occur under each head are, according to my present views, to be regarded as synonyma of the genus under which they are arranged.

In respect to Lamarck's 'Système,' De Montfort's 'Conchology,' Megerle's 'Essay,' Schumacher's 'New System,' Blainville's 'Manuel,' and other works which only give the genera, and simply mention one or two examples as the types of their genus, the species they give as types are here cited; but in works like Linnæus's 'Systema Naturæ,' and Lamarck's 'Histoire,' which give the species of Mollusca, it is not so easy to determine which species the author intended for the type of his genus. In these cases I have chosen either the best known species, or, if the author has given figures, the species which he has figured; the latter is the course that I have adopted with respect to Risso's work, whose genera are so difficult to understand.

In the Linnæan genera in which there is room for doubt, from the miscellaneous character of the species referred to by the author, I have considered the name as restricted to the type which the earliest author after Linnæus has quoted for it: thus as Montfort quotes *Trochus niloticus* as the type of *Trochus*, and Lamarck *Chiton gigas* as the type of *Chiton*, I have regarded these species as the types of the Linnæan genera. This has not been done without consideration, as I was at first inclined to regard the species figured in the plates of the *Fundamenta Testaceologiciæ* (Amoen. Acad. viii. 1785, 107) of Linnæus which are given as illustrative of the greater number of his genera, and of the terms used in describing them, as the types; but I do not think that he had any idea of so considering them, for he gives two species of *Arca*, four of *Patella*, three of *Cypræa*, four of *Murex*, five of *Trochus*, three of *Strombus*, and two of *Anomia*; while the genera *Conus*, *Mytilus* and *Pinna* are not illustrated. Should these figures have been regarded as the types of his genera, then *Ostrea pallium* would be the type of *Ostrea*, *Donax scripta* of *Donax*, *Chama gigas* of *Chama*, *Buccinum Harpa* of *Buccinum*, *Mya pictorum* of *Mya*, *Solen strigillatus* of *Solen*, and *Nautilus Beccaria* of *Nautilus*; species which certainly are not the best that could be chosen to agree with his characters, and to have adopted which would have greatly confused the science.

There is a series of works which appeared between the time of Linnæus and Lamarck which added much to the progress of conchology, but which have been overlooked by the conchologists of the Lamarckian school, as for example 'Meuschen Museum Geverianum,'

Svo, 1787; 'Humphrey's Catalogue of the Calonne Collection,' 8vo, 1797; and the 'Museum Boltenianum,' 12mo, 1798 (which was reprinted at Hamburg in 1819, but neither edition has occurred to me). These catalogues foreshadow the genera which have been since formed and generally adopted, but as they are mostly without characters, or with only very slight ones, I have not adopted the generic names they have given, except where their groups exactly corresponded with those which are now used, and to which new names have been applied, as for example *Neritella* for *Neritina*, &c.; or where the name used by the more modern author was necessary to be changed, because it had previously been used for some other genus of Mollusca.

I have been as careful as I could to give the proper dates of the various genera, especially where there was any doubt about the priority of a name; but where there was no doubt, as for example in the genera named by Lamarck between the publication of his 'Système' and his 'Histoire,' I have been satisfied with giving the dates of the volume of the latter work, without searching out the exact date of the publication in Lamarck's various papers; and I have followed the same course with regard to De Blainville's genera which appeared before the date of his 'Manuel' in the different volumes of the 'Dictionnaire des Sciences Naturelles'; but there are certain works the dates of which it is very difficult to ascertain, such for example as Ferussac's, which have no date marked on them. Others, such as D'Orbigny's 'South America,' the publication of which was spread over eleven years, from 1835 to 1846, and some other works of this author, are in the same predicament, the plates often appearing irregularly, and the text sometimes not till near the completion of the work. The same difficulty occurs in some of our English works, as Sowerby's 'Genera' for example; in these cases the dates assigned can only be regarded as approximative.

I have nearly confined the list to the genera which occur in the recent state: first, because, though I have paid considerable attention to fossil shells, I am not so well acquainted with them as with the recent ones; secondly, because the genera of fossil shells, which must depend on the study and organization of the recent ones, are not so well understood as those which now occur. And the increase in the knowledge of the animal gives us more and more reason to distrust our conclusions with regard to arrangements founded on the study of the shell alone, for it is impossible amongst the recent shells to distinguish the following genera:—

<i>Tectura</i> (<i>Lottia</i>) from	<i>Patella</i> ;
<i>Ancylus</i>	<i>Siphonaria</i> ;
<i>Scutella</i>	<i>Patella</i> ;
<i>Philippia</i>	<i>Solarium</i> ;
<i>Vermetus</i>	<i>Serpula</i> ;
<i>Dentalium</i>	<i>Ditrupa</i> ;

though the four first each belong to different families of Mollusca, and the two latter are Mollusca, and their resemblances Annelides. The knowledge of the animals of *Nautilus* and *Spirula* now renders it

doubtful if *Orthocera* and other allied fossil genera are Decapodous, or Dibranchiate Cephalopods.

The arrangement followed is that which was proposed in the Synopsis of the Contents of the British Museum for 1838, and which has been gradually modified in the different editions, as I have become better acquainted with the animals of the different genera; and one or two alterations have been made for the same reason in this edition of the list. It is founded on the examination of the animals of all the molluscs contained in the London and Paris collections, as well as of all the drawings or engravings of the animals which I have been enabled to see, exceeding more than five thousand species, being at least one hundred times as many animals as were known when Lamarck proposed his system, and fifty times as many as were known to Cuvier when he published his system in the 'Animal Kingdom.'

Cantraine refers *Patella pectinata* (Helcion, *Mont.*) to the genus *Patelloidea*, and D'Orbigny has more lately considered *Helcion* as synonymous with *Acmea*; but the animal of *Patella pectinata* which I examined in Paris in 1820 had gills on the lower edge of its mantle, and is a true *Patellida*. *Seurria* appears by D'Orbigny's description to have the same; do some *Patella*-like animals have gills in both situations?
